riety, where found, amount produced in

UTAH'S SALT GARDENS.

How the Salt Is Harvested on the Lake Shores.

One Field Produces 25,000 Car Loads a Year—The Use of Salt in Silver Mines —Quarrying Salt.

Salt Lake City, Sept. 14.—"Salt," sald a wise youth, "is what makes pointoes taste bad when you don't put any on." For the purpose of this article, the definition is sufficiently scientific, and as to chemical properties, character, variety, where found, amount produced in The Author of the Mines.

The particular field referred to above is grad acres in extent, and has a bearing capacity of 25,000 car loads per annum. Nearly seven miles of spurs from a main railroad switch run out like a fan from the center. This company ships a trainond daily whilst the season is on, paying the Union Pacific railroad \$500,000 a year in freights. Another company, composed largoly of dignitaries of the Mormon church, constructed last year a pond occupying 520 acres, and has completed a railroad thirteen miles long to Salt Lake city, building in addition an immense bathing and the salt product this year is estimated at more than 200,000 tons.

There are several smaller salt farms between Saltair beach and the northern boundary of the lake.

Used IN THE MINES.

as to chemical properties, character, where found, amount produced in the world, together with a mass of statistics and other i formation, see the encycopedias. The present writing is of the sait of Utab, and especially that produced by the woncerial ebbless sea, which is so dense and briny that people cannot sink in it, nor can any creature live beneath its surface.

It is said that sait collects as a crust on the top of some sait lakes, as ice forms on firesh water in the winter. But cerumity this is not so of the Great Sait lake, which neither at the bottom, nor on its shores, gives any sign of its saline nature. The immense weight of its properties is carried entirely in solution of these ingredients is almost the enly one connected with the production of these ingredients is almost the enly one connected with the production of these ingredients is almost the sain has baked the alkaline bottom so that at a little distance the ground looks like an immense pond, contrasting with the deep blue or green of the sea beyond. There are scores of hundreds of cast of such fields whereon are harvested vast quantities of cruce salt without any other agency than the annual rise of the water of the lake, and of the water of the lake and of the western winds spreading the saine liquid out to dry. These poculiar lands were formerly a depression of the lake. In winter time USED IN THE MINES.

SCENES AT THE SALT WORKS,

maying them till the crystalization is complete.

The sait crystals at first formed are about the size of a pea, As the water eraporales they form almost in the same manner that fresh water congeals in winter. A soum collects on the surface, but as sait as heavier than water the crystal naturally precipitates to the bottom. The only ingredient in the water of the Great Sait lake which so precipitates is chloride of southm, or sait, all the impurities remaining an solution. This surprising fact very much simplifies the preparation of the commodity for market.

In order to take up the sait crystals which, in the course of a season, form in almost solid mass to the thickness of four to six luches, and sometimes more, the

to six luches, and sometimes more, the water covering to a is drawn off by gravitation. In this way the concentrated impartities are will be removed, some remaining of the upper turface as a slight soun, visib under a magnifying glass

HAT PESTING THE CROP.

During the band of September the harvest is ready, and it is always greater by hundreds of thousadds of jons than the decand. At this time the water has nearly all evaporated, leaving white fields which lock as though covered with a heavy fall of snow, with some of it partially melted. Along the surface of the gardens placks are laid as a runway for the wheelbarrows (into which the crude salt is accoped) from every part of the field to the center, where come-shaped piles, 57 feet square at the base, and about 7 feet high, are heaped, containing an average of 250 tons each. These salt piles on the field of one of the companies, if joined together, end to end, would extend four and a half miles. Before gathering with the wheelbarrows, which is done by a small army of men wearing colored gorgles, a cutter, made of a gang of carwheels on a single axic, and with sharpsened flanges, is drawn by a team of horse or the flats, breaking up the enormalied crystals. W. And piled, the sait is allowed to remain until orders are received for shipments. The witter rains, instead of dissolving the sait, give it a hard crust that sheds water.

A GENTLE WOMAN Wishes a toilet cream to promote that

Brilliant Transparency of the skin, which is the true

beauty of the complexion.

She wishes it to have the true fragrance of the flowers and the gentle tonic action of the healing balsams, which render the skin soft, white and beautiful without injury to it.

She wishes the refreshing, soothing effect of the best and simplest ingredients blended into a perfect cream. She finds it in Cocona Cream and will have no other.

She never uses the paints and face bleaches which are so injurious to the skin.

GENTLEMEN after shaving find Cocona Cream most excellent.

COCONA WATER is the natural fragrance of flowers for the toilet and bath.

COCONA BALM Prevents and Heals chapping, breaking and roughness of the skin. THE COCONA TOILET SPECIALTIES are manufactured only by the

Cocona Company,

CURRENT TIME TABLE.

Up to a few years ago it was supposed that the only rock salt in the United States was that found in West Virginia. There is a monatain of it in Sanpete county, Utah, from which last your 100 car loads were shipped outside the territory, and thirty car loads to Utah points. It is in Salt creek canyon, six miles east of Nephi. The mine has a face of 100 feet of solid salt, which is quarried the same as stone. A single clast often produces ten tons in lamps of 10 to 200 pounds.

This rock salt is shipped to Butte, Heiena and to points in Nevada and Colorado. It is used in the mines for fluxing and on the cattle ranges as a lick. At Salina, in Sevier county, there are also works of some magnitude.

All the Utah salt works produce what is called "Liverpool" salt, which is the standard of commerce for dairy and table use. The Cheshire, or Liverpool salt, indeed, possesses no qualities superior to those of Utah manufacture.

As an interesting fact it may be stated that when a high wind from the west is blowing, the vapors from the saline gardens at Salt Lake sensibly impregnate the atmosphere in the city, thirteen to fifteen miles away, and, when accompanied with rain, will leave salt stains upon exposed articles.
